## Globe Control Valve

**OPTIMUX**

# OpGL

## Control Valve

The OpGL globe control valve provides a superior performance, while permitting easy, fast, inexpensive maintenance. Unlike diaphragm-operated control valves, the spring cylinder-actuated OpGL provides stiffness and maintains high positioning accuracy controlled, and a faithful response. Since it handles up to 150 psi (10.3 Barg) supply air, it also has the thrust necessary to shut off against much higher fluid pressures.

Most diaphragm actuators rely entirely on springs to close the valve. But with the OpGL control valve, the spring force, the supply air pressure and the fluid pressure itself, are combined to produce and exceptionally tight shutoff. Because of its self-aligning seat ring, shutoff is made easier to be achieved in the OpGL control valve.

Most common maintenance problems with globe control valves can be traced to cage-guiding. The close metal-to-

metal contact between the cage and the plug often results in galling and sticking. That is why the OpGL is double-top stem guided thus completely avoiding contact between the plug and the seat retainer.

The clamped-in seat and top entry trim permits easy, quick maintenance. Plus, with OpGL's high degree of parts interchangeability, fewer inventory parts are needed and costs are therefore reduced.

The actuator is also of a compact design, smaller, lighter and easier to handle than comparable diaphragm actuators. With Optimux's quick-and-express manufacturing system, shorter deliveries at no extra costs are possible for the customer. OpGL. The simple, reliable, rugged and economic globe valve.

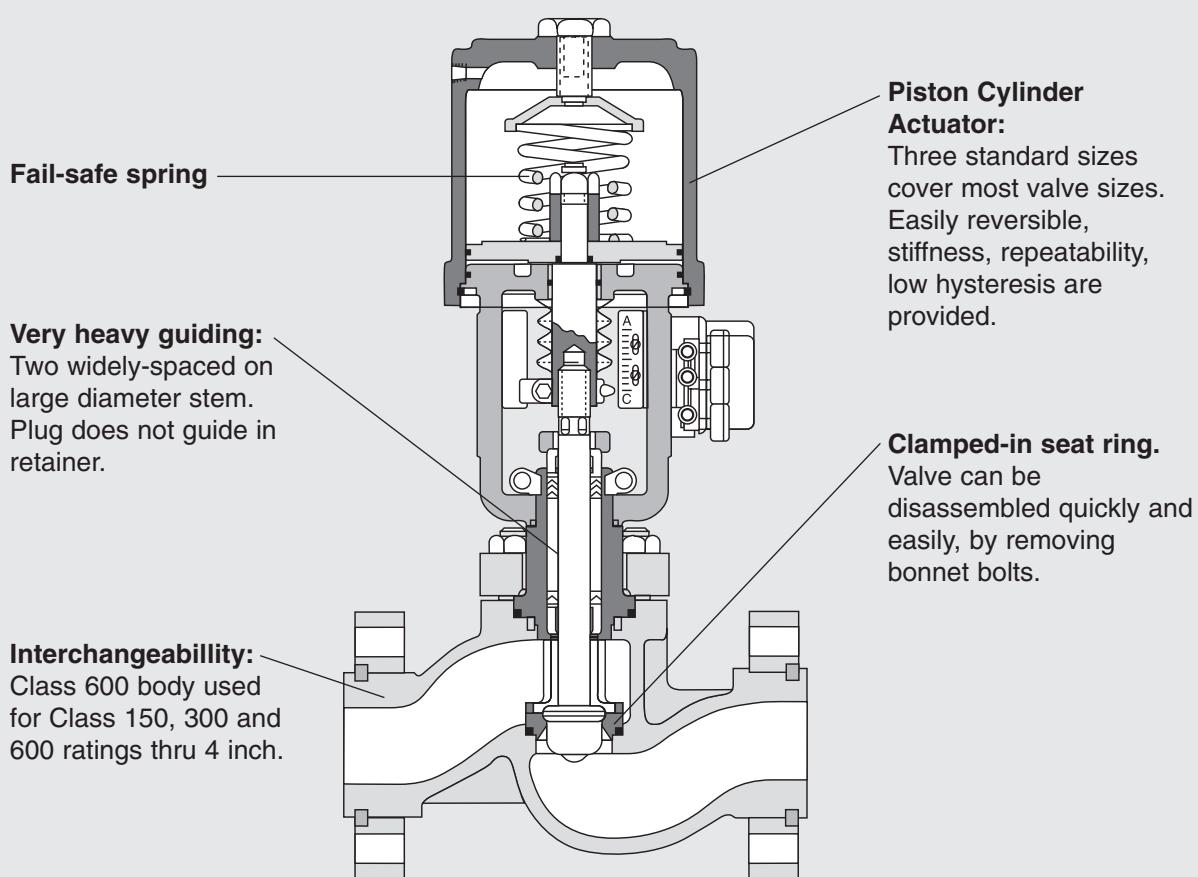

Figure 1: OpGL Body Assembly, Class 150, 300 and 600

## OpGL Body Styles

### Globe Style Body

Globe-style bodies feature smooth, streamlined, constant area internal passages with no pockets, permitting high capacity with minimum turbulence.

They are designed with nearly constant wall thickness, providing lower weight and cost, specially when the body is manufactured in stainless steel or expensive alloy steels.

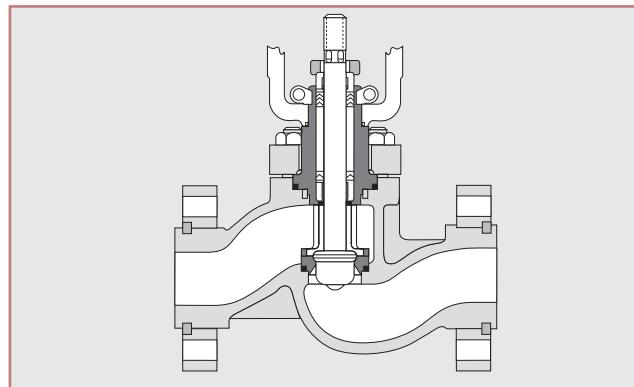

Figure 2: Globe Style body

### Angle Style Body

The angle-style OpGL is completely interchangeable with the globe-style. Except for the body, all other valve parts remain the same. For additional protection of the body, a special Venturi seat ring which extends to the outlet flange is available, if required.

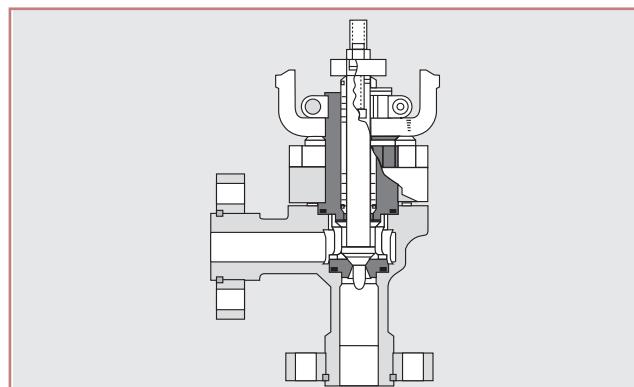

Figure 3: Angle Style body

### Three-way Body

Three-way bodies are used to either combining or diverting services. Due to Optimux's excellent parts interchangeability, a standard globe valve easily converts to three-way service with the addition of a three-way adapter, upper seat ring, two gaskets, and a three-way plug.

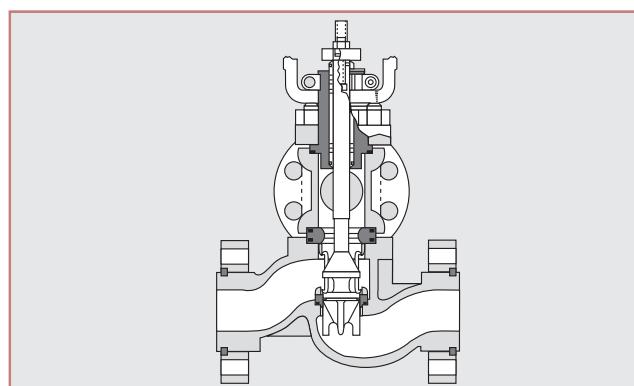

Figure 4: Three-way body

### Steam Jacketed Body

The steam jacketed OpGL uses a standard globe-style body with oversized, blind flanges for a full jacket or standard flanges for a partial jacket. The jacket is rated for 150 psi (**10.3 barg**) and is equipped with a 3/4" NPT supply and drain connection.

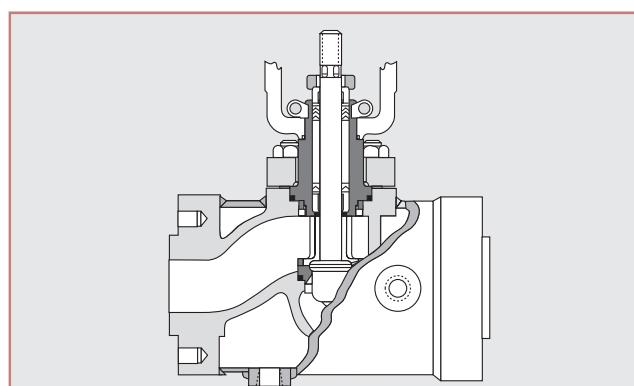

Figure 5: Steam Jacketed Body

# **OpGL**

## Features and Advantages

### **Performs exactly as required**

- High thrust rugged piston cylinder actuator
- Precise throttling
- High repeatability
- Trusty response
- High travel speed controlled

### **Galling and sticking not possible, prevent process breakdown**

- Cage-guiding design not applicable
- Double stem guides positioned away from flowing medium
- Large clearance completely avoids contact between plug head and seat retainer

### **Easy, fast, inexpensive maintenance**

- Top entry, quick maintenance
- Clamped-in seat ring
- Uniformly compressed and controlled packing
- Separable flanges
- High interchangeability of valve parts
- Weight and dimensions reduced

### **Tight shutoff guaranteed when required to close**

- Reinforced spring piston cylinder actuator
- Self-aligning seat ring
- Fluid pressure, actuator spring and cylinder pressure assisted tight shutoff
- If fail safe happens, the spring strokes the valve into the desired position while extra air pressure force is maintained

### **Toughest services construction**

- Corrosion resistant construction
- High seating force
- Special anti-cavitation and noise attenuator cartridges optional
- Heavy duty plug stem available

### **Compact, easy installation**

- The piston cylinder actuator is smaller in size than comparable spring diaphragm actuators
- Lower center of gravity than comparable spring diaphragm actuators
- Valve weight lighter means reduced dynamic and static load on the pipeline
- Separable end flanges allow for multiple installation patterns thus compensating for any flange misalignment

### **Life time lower cost design**

- High interchangeability between sizes and other Optimux products during the valve service life time.
- Valve design allows for a low inventory of parts
- Heavy duty designed parts assure a longer servicing life
- The piston cylinder actuator design permits easy and simple maintenance operations

### **High performance four-way Positioners**

- Pneumatic 3-15 psi
- Eletropneumatic 4-24 mA
- Digital

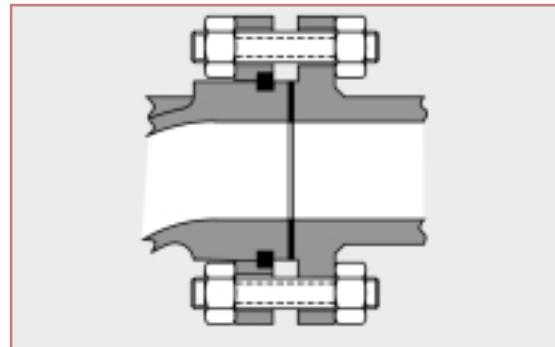

**OpGL**

## End connections, Flanges and Bolting

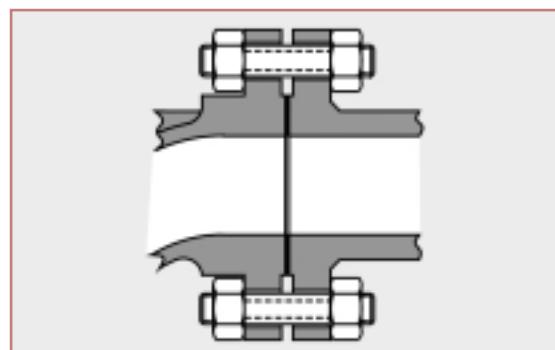

OpGL body facings come standard as raised face for either separate and integral flanges. To achieve better sealing with mating piping, the flange face is machined with spiral groove serrations. Other optional facings include smooth face, flat face, ring joint, large and small tongue and large and small groove.

### Separable End Flanges

Interchangeable separable flanges are standard for valve bodies through 4 inch in class 150, 300, and 600 ANSI ratings. With separable end flanges, a class 600 body can be adapted for class 150, 300, or 600 service by simply changing the end flanges. Separable flanges are usually furnished in carbon steel for maximum cost savings, although stainless steel can be specified if process atmosphere or extreme temperature requires it.

**Figure 6: Separable flanges**

**Fig. 7: Integral Flanges**

### Bonnet Flanges

The bonnet flange incorporates the same separable design as the end flanges. It is normally manufactured in carbon steel; however, it too can be specified in stainless steel when required.

### Bonnet Flange Bolting

Standard bonnet utilizes screwed studs and nuts. Standard material for the studs are ASTM A 193 Gr B7 and nuts ASTM A 194 Gr 2H, suitable for temperatures between -20°F to 800 °F (-29°C to 426°C). Studs and nuts can be also furnished in stainless steel and are suitable for temperatures between -423°F to 1500°F (-253° to 816°C). These temperature limits are for maximum pressure permitted by ASTM B 16.34 - 1988.

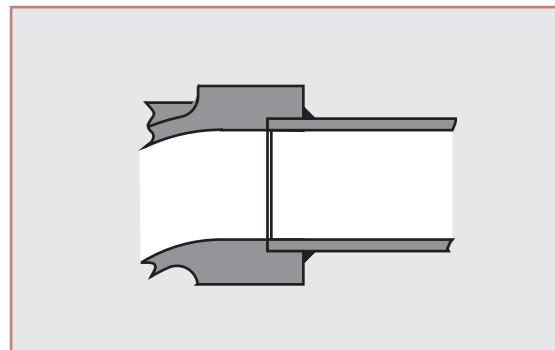

**Table I: End connections**

End Connections	Valve size (inches)	ANSI class	Standard Face-to-face	Optional Face-to-face

# OpGL

## Gaskets

The OpGL is designed with the bonnet and seat ring gaskets fully retained. Since the bonnet bottoms metal-to-metal in the body, the bonnet gasket compression is determined by the depth of the gasket step on the bonnet which is machined to provide the compression required by the gasket manufacturer.

When the bonnet is fully installed, force is transmitted through the seat retainer to secure the seat ring in position

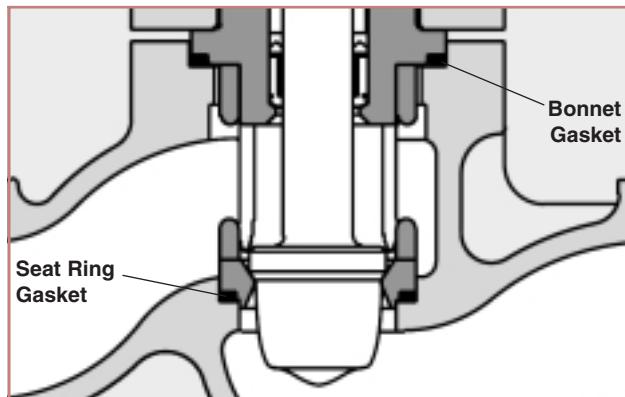

Figure 10: Body Gasket Unbalanced Trim

The body, seat retainer and seat ring are all machined to close tolerances to provide the proper gasket compression. Unlike the bonnet, the seat ring does not bottom in the body, allowing this small clearance to compensate for manufacturing tolerances and thermal expansion.

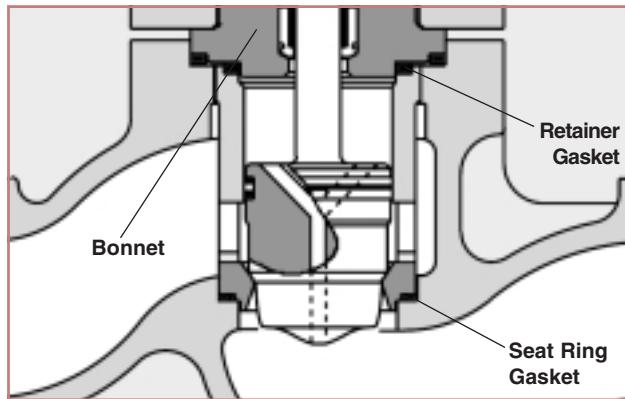

Figure 11: Body Gasket Balance trim

Table II: Gasket Specifications

	Type	Gasket Material	Maximum Gasket Temperature		Minimum Gasket Temperature

**OpGL**

## Bonnet Types

### Standard Bonnet

The OpGL standard bonnet is constructed of the same material as the body, and handles fluid temperatures from -20°F to 750°F (-30°C to 400°C) (See Table on page 8 for packing limitations).

### Extended Bonnet

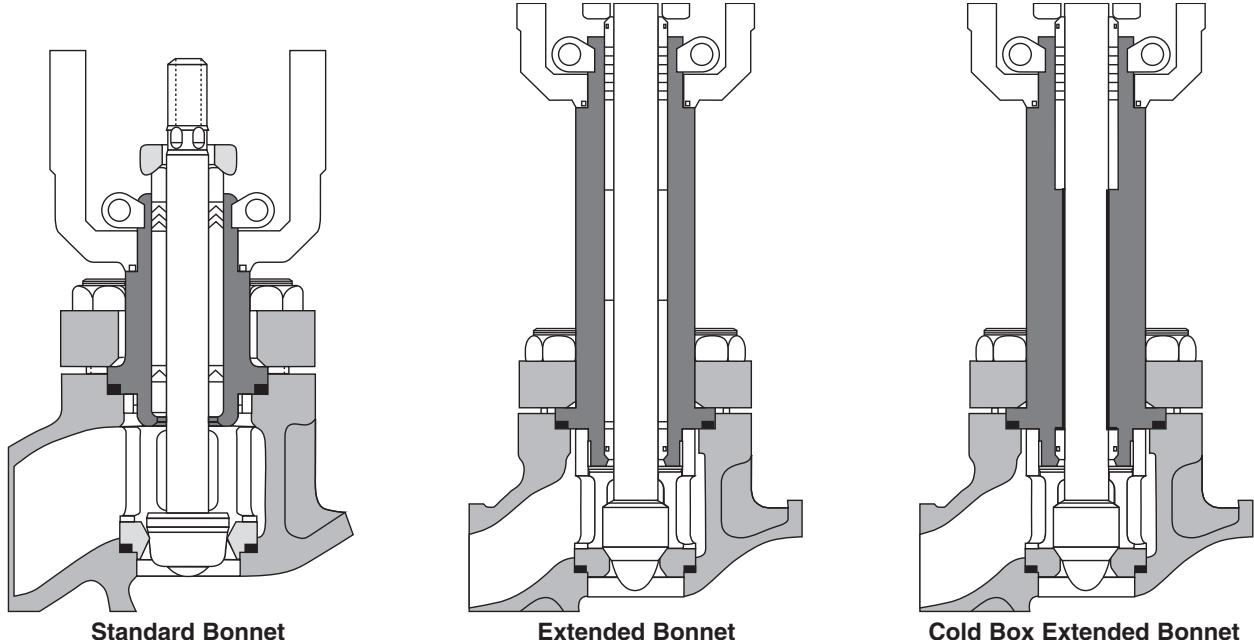

The extended bonnet protects the packing from excessive heat or cold which may inhibit valve performance. It is constructed of carbon steel for temperatures from -20°F to 800°F

(-30°C to 427°C) and of 304 or 316 stainless steel for temperatures from -150°F to 1500°F (-100°C to 816°C).

### Cold Box Extended Bonnet

The cold box extended bonnet permits stagnated, moderate temperature gas to form in the bonnet, which protects the packing from the service fluid. It is usually manufactured from 304 or 316 stainless steel to handle fluid temperatures down to -423°F (-253°C).

Standard construction consists of stainless steel bonnet flange and bolting

**Figure 12: Bonnet Types for OpGL**

**Table III : Materials: Bonnet Flanges, Screws**

Valve size (inches)	Standard Bonnet Flange	Optional Flange	Cap Screws Standard	Cap Screws Optional
1/2 to 3 Class 150-600	Carbon Steel	Stainless Steel (1) Same Body Alloy Material	SAE Grade 5	SS. Series 300 B7-2H Stainless steel (4) 304 and 316 (3,4)

(1) When Pressure and temperature exceeds standard limitations for flanges and bolting constructed in carbon steel, and B7-2H, alloy material is required.

(2) Limit temperature from -20°F to 800°F (-29°C to 427°C). See for body temperature limitations.

(3) Limit temperature from -428 to 1500°F (-253°C to 816°C). See for body temperature limitations.

(4) Other materials are dependable on design configurations.

# OpGL

## Packing and Guiding

### Packing Box

Standard Optimux packing boxes are deeper than most conventional types, providing the following advantages:

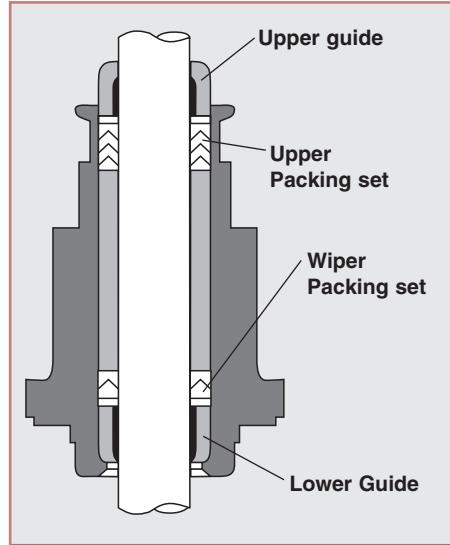

1. Wide spacing between the wiper set and the main upper packing set. The upper set is positioned far enough away from the wiper set to avoid contact with any part of the

plug stem which has been exposed to the flowing medium.

2. Two widely spaced stem guides, when used with the large plug stem diameter, provide exceptional guiding. The upper stem guide also acts as a packing follower. The lower guide is situated close to the plug head for additional guiding support.

**Table IV: Guides Material**

Standard Material	Maximum Temperature		Minimum Temperature		Maximum Pressure
	°F	°C	°F	°C	
Grafoil lined Stainless Steel <sup>6</sup>	1500	816	-320	-196	1000 psig up to 2 inch. 600 psig 3 and 4 inch. 500 psig 6 inch. and above
Glass-loaded	350	177	-50	-45	150 psig @ 100°F
Teflon-lined SS	350	177	-423	-253	100 psig @ 350°F
Solid Bronze	500	260	-423	-253	Same as the body
Solid Stellite	1500	816	-423	-253	Same as the body

**Figure 13: Teflon V-Ring Typical Arrangement**

- (1) ANSI B16.34 specifies acceptable pressure temperature limits for pressure retaining materials. Consult Optimux for additional information.
- (2) When used with adequate body and Teflon TFE Bonnet materials.
- (3) PTFE can be used in temperatures down to -423°F (-253°C).
- (4) Sizes from 8 to 12 inches class ANSI 150-600 and 3 to 12 inches, class ANSI 900-2500 can be used in temperatures up to 850°F (455°C).
- (5) Asbestos free packing. High temperature packing.
- (6) Do not use Grafoil above 800°F (427°C) in oxidizing service such as air or oxygen.
- (7) For pressure limitations consult Optimux "Control Valve Selection and Sizing Manual".

**OpGL**

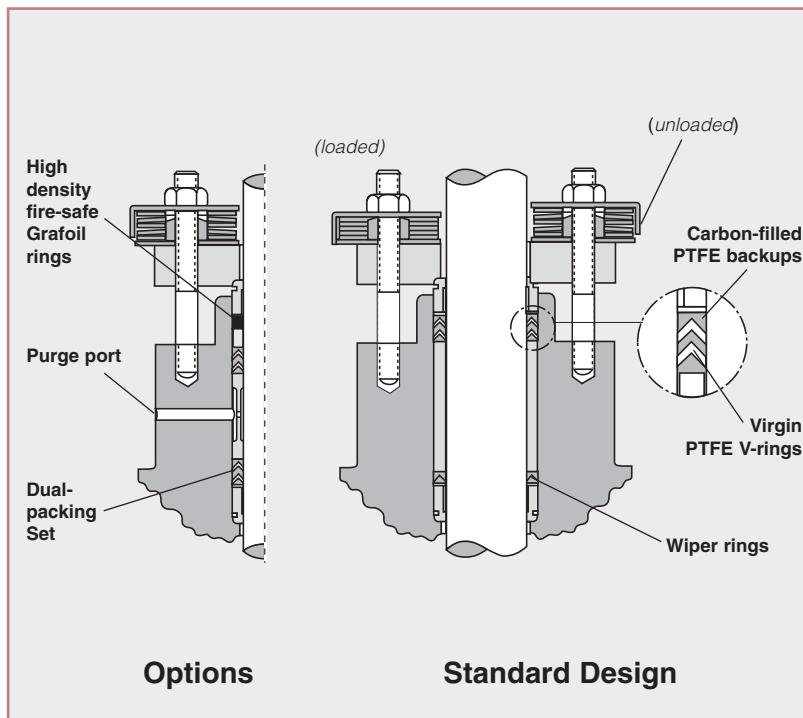

# Fugitive Emission Control

## PTG Packing

The Optimux PTG packing complies with the regulations of the EPA (U.S. Environmental Protection Agency) on packing fugitive emissions. Designed as a packing set combination of carbon-filled Teflon backup V-rings, PTG can be installed in all existing Optimux control valves.

Provided with a simple and easy retrofittable system, it permits also monitoring whether maintenance procedures have been performed properly.

In addition, a fire-safe PTG packing set can be furnished on request in case of fire, the packing set is guaranteed against fluid leaks through the stem, even under packing set damage caused by excess of heat.

**Figure 14: PTG Packing Set**

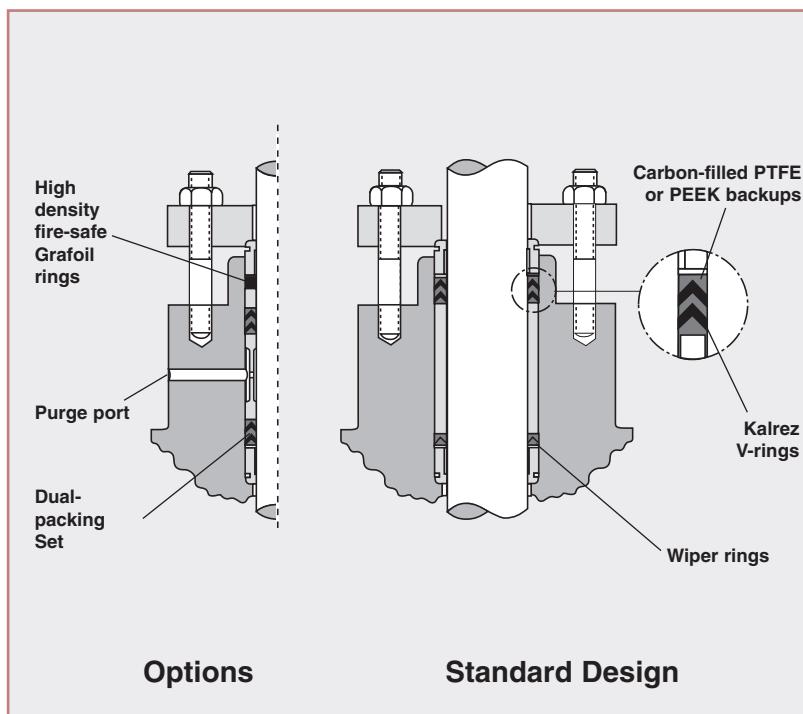

## PT Packing

When temperature exceeds that specified for the standard V-rings or when a high temperature are expected, PT packing set is recommended.

As a cost efficient response to the EPA regulations, the PT packing set provides a typical fugitive emission rate lower than 10 ppm, becoming significantly reliable and more economical than metal bellows seal systems.

PT packing can be installed in all Optimux's rotary and globe control valves. It was designed to achieve a long-life expectancy eliminating the needs for packing set retightening.

PT packing set is also provided in a fire-safe version to prevent leaks through the shaft in case of fire, according to the API 607 standards.

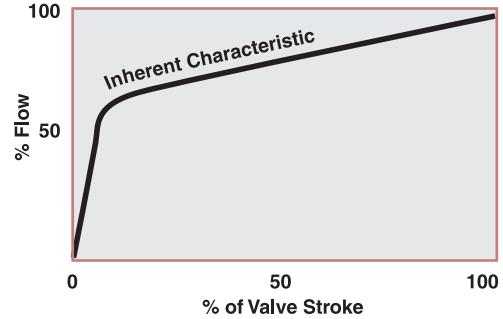

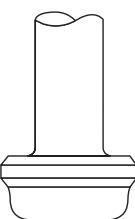

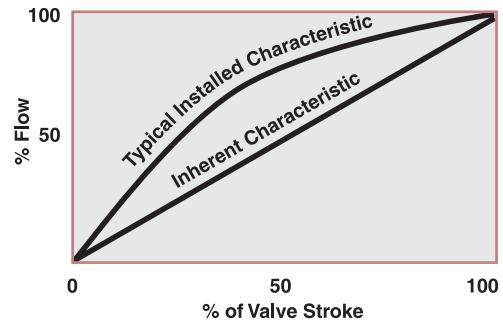

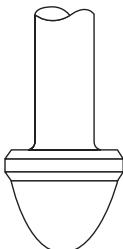

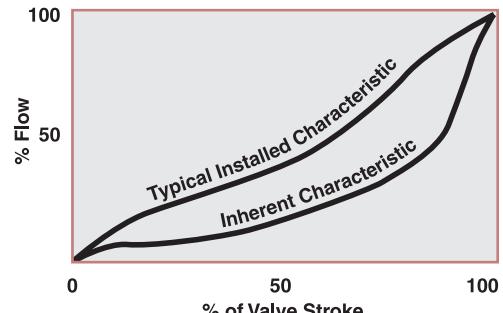

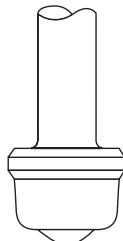

**Figure 15: PT Packing Set**

## Flow Characteristics

### Equal Percentage

Equal percentage is the characteristic most commonly used in process control. The change in flow per unit of valve stroke is directly proportional to the flow occurring just before the change is made. While the flow characteristic of the valve itself may be equal percentage, most common loops will produce an installed characteristic approaching linear when the overall system pressure drop is large relative to that across the valve.

### Linear

Linear inherent characteristic produces equal changes in flow per unit of valve stroke regardless of plug position. Linear plugs are used on those systems where the valve pressure drop is a major portion of the total system pressure drop.

### Quick Open

Quick open plugs are used for on-off services and are designed to produce maximum flow quickly.

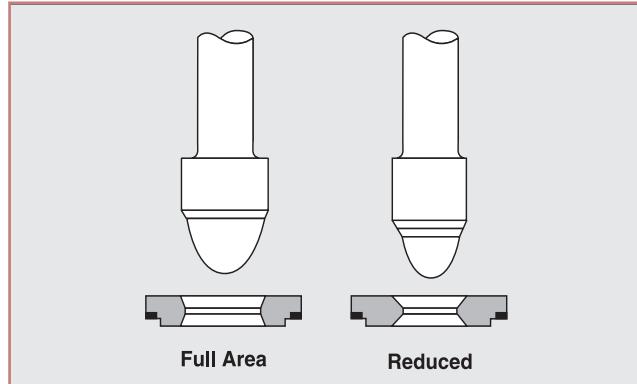

Figure 17: Typical Trim Types

## OpGL

### Trim, Seats

OpGL trim is designed to avoid the difficulties associated with screwed-in seats and cage-guiding. Since the seat ring is not screwed-in but clamped into the body by the bonnet and seat retainer, removal of the seat is easy even under extremely corrosive conditions.

Unlike cage-guided trims, which easily gall and stick, OpGL plugs are double stem guided, avoiding contact between the seat retainer and plug. Because no contact is made with the plug, the retainer can be constructed of stainless steel rather than costly hard materials. The flow characteristic is determined by the plug contour,

rather than by the opening in the retainer. Optionally gaseous noise attenuation trims can be provided to effectively improve noise level reduction in OpGL valves. For very high pressure drops, pressure-balanced trim is used to reduce the thrust necessary to stroke the plug by reducing the trim off-balance area.

Flow direction is under the plug for fail-closed and over the plug for fail-open.

The seal area less the stem area is designed to be slightly larger than the seat area, thus the plug is off-balance to close for flow under the seat and off-balance to open for flow over the seat.

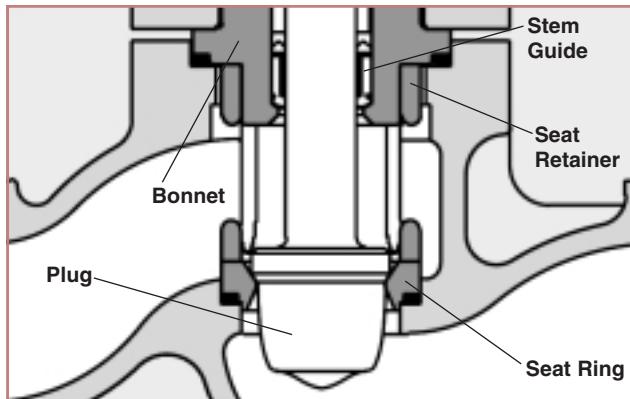

Figure 18: Standard Trim

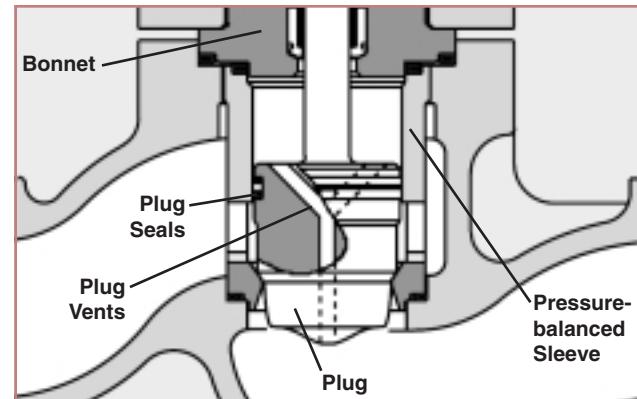

Figure 19: Balanced Trim

## Seats

### Metal Seats

Metal seated OpGL handless Class IV shutoff (ANSI B16.104; 1976-FCI 70-2). This class calls for maximum permissible seat leakage of 0,01% of rated valve capacity.

This exceptional seat tightness is obtained by aligning the seat ring with the plug during assembly. Additional seat tightness using metal seats is available as an option.

Table VI: Plug Seals Temperature Range for Pressure-balance Trim

Teflon Seal	-320°F @ full body rating or 300°F @ 150 psig
Ni-resist Piston Rings	-22°F to 800°F
Buna-N O-rings	-60°F to 250°F
Rene 41	800°F to 1600°F
Spring-reinforced TFE	-365°F to 575°F
Viton	-40°F to 437°F

### Soft Seats

The OpGL soft seat is used in applications requiring ANSI Class VI "bubble-tight" shutoff.

It's design consists of an elastomer sandwiched between two metal pieces. The assembled soft seat is interchangeable with the hard seat for a given size and pressure rating. Inserts are often constructed of Teflon, therefore, maximum temperature should be below 150°C at 20 Barg.

For temperatures below -65°C, Teflon soft seats can be used in high pressure applications.

## Trim, Materials

**Table VII: Wear and Galling Resistance of Material Combinations**

Standard plug and seat ring material is 316 stainless steel, except in the case of special alloy bodies where trims are sometimes furnished in the same material as the body. A wide variety of fluids are successfully handled by stainless steel trim parts. Nevertheless, as a general rule hard trim must be used for all chocked flow conditions or for temperatures above 600°F (316°C). Optimux keeps a large stock of no. 6 Stellite trim parts. This material offers a good combination of relative hardness and corrosion resistance.

Special alloys such as Alloy 20, Hastelloy C and Monel can be furnished on request.
